## NeoColab\_REC\_CS23221\_Python Programming

### REC\_Python\_Week 6\_MCQ

Attempt : 1  
Total Mark : 20  
Marks Obtained : 19

#### Section 1 : MCQ

1. What happens if an exception is not caught in the except clause?

**Answer**

The program will display a traceback error and stop execution

**Status : Correct**

**Marks : 1/1**

2. What will be the output of the following Python code?

```
# Predefined lines to simulate the file content
lines = [
    "This is 1st line",
    "This is 2nd line",
    "This is 3rd line",
    "This is 4th line",
```

```
"This is 5th line"
]

print("Name of the file: foo.txt")

# Print the first 5 lines from the predefined list
for index in range(5):
    line = lines[index]
    print("Line No %d - %s" % (index + 1, line.strip()))
```

**Answer**

Displays Output

**Status :** Correct

**Marks :** 1/1

3. Which of the following is true about  
fp.seek(10,1)

**Answer**

Move file pointer ten characters ahead from the current position

**Status :** Correct

**Marks :** 1/1

4. What will be the output of the following Python code?

```
f = None
for i in range (5):
    with open("data.txt", "w") as f:
        if i > 2:
            break
print(f.closed)
```

**Answer**

True

**Status :** Correct

**Marks :** 1/1

5. Which of the following is true about the finally block in Python?

**Answer**

The finally block is always executed, regardless of whether an exception occurs or not

**Status :** Correct

**Marks :** 1/1

6. What is the purpose of the except clause in Python?

**Answer**

To handle exceptions during code execution

**Status :** Correct

**Marks :** 1/1

7. Fill in the code in order to get the following output:

Output:

Name of the file: ex.txt

```
fo = open(_____(1), "wb")
print("Name of the file: ",_____(2))
```

**Answer**

1) "ex.txt" 2) fo.name

**Status :** Correct

**Marks :** 1/1

8. What is the output of the following code?

```
try:
```

```
    x = "hello" + 5
```

```
except TypeError:
```

```
    print("Type Error occurred")
```

```
finally:
```

```
    print("This will always execute")
```

**Answer**

Type Error occurred This will always execute

**Status :** Correct

**Marks :** 1/1

9. What happens if no arguments are passed to the seek function?

**Answer**

error

**Status :** Wrong

**Marks :** 0/1

10. Which clause is used to clean up resources, such as closing files in Python?

**Answer**

finally

**Status :** Correct

**Marks :** 1/1

11. Match the following:

- a) f.seek(5,1) i) Move file pointer five characters behind from the current position
- b) f.seek(-5,1) ii) Move file pointer to the end of a file
- c) f.seek(0,2) iii) Move file pointer five characters ahead from the current position
- d) f.seek(0) iv) Move file pointer to the beginning of a file

**Answer**

a-iii, b-i, c-ii, d-iv

**Status :** Correct

**Marks :** 1/1

12. What is the default value of reference\_point in the following code?

`file_object.seek(offset [,reference_point])`

**Answer**

0

**Status : Correct**

**Marks : 1/1**

13. How do you create a user-defined exception in Python?

**Answer**

By creating a new class that inherits from the Exception class

**Status : Correct**

**Marks : 1/1**

14. What is the difference between r+ and w+ modes?

**Answer**

in r+ the pointer is initially placed at the beginning of the file and the pointer is at the end for w+

**Status : Correct**

**Marks : 1/1**

15. What is the correct way to raise an exception in Python?

**Answer**

`raise Exception()`

**Status : Correct**

**Marks : 1/1**

16. What is the output of the following code?

```
class MyError(Exception):  
    pass
```

```
try:  
    raise MyError("Something went wrong")
```

```
except MyError as e:  
    print(e)
```

**Answer**

Something went wrong

**Status :** Correct

**Marks :** 1/1

17. Fill in the blanks in the following code of writing data in binary files.

```
import _____ (1)  
rec=[]  
while True:  
    rn=int(input("Enter"))  
    nm=input("Enter")  
    temp=[rn, nm]  
    rec.append(temp)  
    ch=input("Enter choice (y/N)")  
    if ch.upper=="N":  
        break  
f.open("stud.dat", "_____")(2)  
_____.dump(rec,f)(3)  
_____.close()(4)
```

**Answer**

(pickle,wb,pickle,f)

**Status :** Correct

**Marks :** 1/1

18. Fill the code to in order to read file from the current position.

Assuming exp.txt file has following 3 lines, consider current file position is beginning of 2nd line

Meri,25

John,21

Raj,20

Ouput:

```
['John,21\n','Raj,20\n']
```

```
f = open("exp.txt", "w+")
```

```
_____ (1)
```

```
print _____ (2)
```

**Answer**

```
1) f.seek(0, 1) 2) f.readlines()
```

**Status : Correct**

**Marks : 1/1**

19. What is the output of the following code?

```
try:
```

```
    x = 1 / 0
```

```
except ZeroDivisionError:
```

```
    print("Caught division by zero error")
```

```
finally:
```

```
    print("Executed")
```

**Answer**

```
Caught division by zero errorExecuted
```

**Status : Correct**

**Marks : 1/1**

20. How do you rename a file?

**Answer**

```
os.rename(existing_name, new_name)
```

**Status : Correct**

**Marks : 1/1**

## NeoColab\_REC\_CS23221\_Python Programming

### REC\_Python\_Week 6\_COD

Attempt : 1  
Total Mark : 50  
Marks Obtained : 50

### Section 1 : Coding

#### 1. Problem Statement

Sophie enjoys playing with words and wants to count the number of words in a sentence. She inputs a sentence, saves it to a file, and then reads it from the file to count the words.

Write a program to determine the number of words in the input sentence.

File Name: sentence\_file.txt

#### ***Input Format***

The input consists of a single line of text containing words separated by spaces.

#### ***Output Format***

The output displays the count of words in the sentence.

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: Four Words In This Sentence

Output: 5

### **Answer**

```
# You are using Python
with open("sentence_file.txt","w") as file:
    s=input()
    c=1
    if s==" ":
        print(0)
    else:
        for i in s:
            if i==" ":
                c=c+1
        print(c)
```

**Status :** Correct

**Marks : 10/10**

## **2. Problem Statement**

Tara is a content manager who needs to perform case conversions for various pieces of text and save the results in a structured manner.

She requires a program to take a user's input string, save it in a file, and then retrieve and display the string in both upper-case and lower-case versions. Help her achieve this task efficiently.

File Name: text\_file.txt

### **Input Format**

The input consists of a single line containing a string provided by the user.

### **Output Format**

The first line displays the original string read from the file in the format: "Original String: {original\_string}".

The second line displays the upper-case version of the original string in the format: "Upper-Case String: {upper\_case\_string}".

The third line displays the lower-case version of the original string in the format: "Lower-Case String: {lower\_case\_string}".

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: #SpecialSymBoLs1234

Output: Original String: #SpecialSymBoLs1234

Upper-Case String: #SPECIALSYMBOLS1234

Lower-Case String: #specialsymbols1234

### **Answer**

```
# You are using Python
with open("text_file.txt","w") as file:
    s=input()
    print(f"Original String: {s}")
    u=s.upper()
    print(f"Upper-Case String: {u}")
    l=s.lower()
    print(f"Lower-Case String: {l}")
```

**Status :** Correct

**Marks : 10/10**

## **3. Problem Statement**

A retail store requires a program to calculate the total cost of purchasing a product based on its price and quantity. The program performs validation to ensure valid inputs and handles specific error conditions using exceptions:

Price Validation: If the price is zero or less, raise a ValueError with the

message: "Invalid Price".Quantity Validation: If the quantity is zero or less, raise a ValueError with the message: "Invalid Quantity".Cost Threshold: If the total cost exceeds 1000, raise RuntimeError with the message: "Excessive Cost".

### ***Input Format***

The first line of input consists of a double value, representing the price of a product.

The second line consists of an integer, representing the quantity of the product.

### ***Output Format***

If the calculation is successful, print the total cost rounded to one decimal place.

If the price is zero or less prints "Invalid Price".

If the quantity is zero or less prints "Invalid Quantity".

If the total cost exceeds 1000, prints "Excessive Cost".

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 20.0

5

Output: 100.0

### ***Answer***

```
# You are using Python
class Price_Validation(Exception):
    pass
class Quantity_Validation(Exception):
    pass
class Cost_Threshold(Exception):
    pass
try:
    p=float(input())
    q=int(input())
```

```
c=p*q
if p<=0:
    raise Price_Validation
elif q<=0:
    raise Quantity_Validation
elif c>1000:
    raise Cost_Threshold
else:
    print(c)
except Price_Validation:
    print("Invalid Price")
except Quantity_Validation:
    print("Invalid Quantity")
except Cost_Threshold:
    print("Excessive Cost")
```

**Status :** Correct

**Marks :** 10/10

#### 4. Problem Statement

In a voting system, a person must be at least 18 years old to be eligible to vote. If a user enters an age below 18, the system should raise a user-defined exception indicating that they are not eligible to vote.

##### ***Input Format***

The input contains a positive integer representing age.

##### ***Output Format***

If the age is less than 18, the output displays "Not eligible to vote".

Otherwise, the output displays "Eligible to vote".

Refer to the sample output for formatting specifications.

##### ***Sample Test Case***

Input: 18

Output: Eligible to vote

**Answer**

```
# You are using Python
class not_eligible(Exception):
    pass
try:
    a=int(input())
    if a>=18:
        print("Eligible to vote")
    else:
        raise not_eligible
except not_eligible:
    print("Not eligible to vote")
```

**Status :** Correct**Marks :** 10/10**5. Problem Statement**

Write a program that calculates the average of a list of integers. The program prompts the user to enter the length of the list (n) and each element of the list. It performs error handling to ensure that the length of the list is a non-negative integer and that each input element is a numeric value.

**Input Format**

The first line of the input is an integer n, representing the length of the list as a positive integer.

The second line of the input consists of an element of the list as an integer, separated by a new line.

**Output Format**

If the length of the list is not a positive integer or zero, the output displays "Error: The length of the list must be a non-negative integer."

If a non-numeric value is entered for the length of the list, the output displays "Error: You must enter a numeric value."

If a non-numeric value is entered for a list element, the output displays "Error: You must enter a numeric value."

If the inputs are valid, the program calculates and prints the average of the provided list of integers with two decimal places: "The average is: [average]".

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: -2

1  
2

Output: Error: The length of the list must be a non-negative integer.

### **Answer**

```
# You are using Python
class neg_num(Exception):
    pass
class non_numeric(Exception):
    pass
try:
    n=input()
    l=[]
    s=0
    try:
        n1=int(n)
    except ValueError:
        raise non_numeric
    if n1<=0:
        raise neg_num
    for i in range(n1):
        e=input()
        if not e.isdigit():
            raise non_numeric
        e1=int(e)
        s=s+e1
        l.append(e1)
    avg=float(s/n1)
```

```
print(f"The average is: {avg:.2f}")  
except neg_num:  
    print("Error: The length of the list must be a non-negative integer.")  
except non_numeric:  
    print("Error: You must enter a numeric value.")
```

**Status :** Correct

**Marks :** 10/10

## NeoColab\_REC\_CS23221\_Python Programming

### REC\_Python\_Week 6\_CY

Attempt : 1  
Total Mark : 40  
Marks Obtained : 40

### Section 1 : Coding

#### 1. Problem Statement

Alice is developing a program called "Name Sorter" that helps users organize and sort names alphabetically.

The program takes names as input from the user, saves them in a file, and then displays the names in sorted order.

File Name: sorted\_names.txt.

#### ***Input Format***

The input consists of multiple lines, each containing a name represented as a string.

To end the input and proceed with sorting, the user can enter 'q'.

### **Output Format**

The output displays the names in alphabetical order, each name on a new line.

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: Alice Smith  
John Doe  
Emma Johnson

q

Output: Alice Smith  
Emma Johnson  
John Doe

### **Answer**

```
# You are using Python
with open("sorted_names","w")as file:
    l=[]
    for i in range(20):
        n=input()
        if n!='q':
            l.append(n)
        if(n=='q'):
            break
    l.sort()
    for i in l:
        print(i)
```

**Status :** Correct

**Marks : 10/10**

## **2. Problem Statement**

A shopkeeper is recording the daily sales of an item for N days, where the price of the item remains the same for all days. Write a program to calculate the total sales for each day and save them in a file named sales.txt that can store the data for a maximum of 30 days. Then, read the file and display the total earnings for each day.

Note: Total Earnings for each day = Number of Items sold in that day × Price of the item.

### ***Input Format***

The first line of input consists of an integer N, representing the number of days.

The second line of input consists of N space-separated integers representing the number of items sold each day.

The third line of input consists of an integer M, representing the price of the item that is common for all N days.

### ***Output Format***

If the number of days entered exceeds 30 ( $N > 30$ ), the output prints "Exceeding limit!" and terminates.

Otherwise, the code reads the contents of the file and displays the total earnings for each day on separate lines.

Contents of the file: The total earnings for N days, with each day's earnings appearing on a separate line.

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: 4

5 10 5 0

20

Output: 100

200

100

0

**Answer**

```
# You are using Python
with open("sales","w") as file:
    n=int(input())
    l=list(map(int,input().split()))
    m=int(input())
    if n>30:
        print("Exceeding limit!")
    else:
        for i in range(n):
            print(l[i]*m)
```

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement

Write a program to read the Register Number and Mobile Number of a student. Create user-defined exception and handle the following:

If the Register Number does not contain exactly 9 characters in the specified format(2 numbers followed by 3 characters followed by 4 numbers) or if the Mobile Number does not contain exactly 10 characters, throw an `IllegalArgumentException`. If the Mobile Number contains any character other than a digit, raise a `NumberFormatException`. If the Register Number contains any character other than digits and alphabets, throw a `NoSuchElementException`. If they are valid, print the message 'valid' or else print an Invalid message.

#### **Input Format**

The first line of the input consists of a string representing the Register number.

The second line of the input consists of a string representing the Mobile number.

#### **Output Format**

The output should display any one of the following messages:

If both numbers are valid, print "Valid".

If an exception is raised, print "Invalid with exception message: ", followed by the specific exception message.

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: 19ABC1001

9949596920

Output: Valid

### **Answer**

# You are using Python

```
class illegalargument(Exception):
```

```
    pass
```

```
class numberformat(Exception):
```

```
    pass
```

```
class nosuchelement(Exception):
```

```
    pass
```

```
def valreg(n):
```

```
    if len(n)!=9:
```

```
        raise illegalargument("Register Number should have exactly 9  
characters.")
```

```
    if not ((n[:2].isdigit())and(n[2:5].isalpha())and(n[5:].isdigit())):
```

```
        raise illegalargument("Register Number should have the format: 2  
numbers,3 characters,and 4 numbers.")
```

```
    if not n.isalnum():
```

```
        raise nosuchelement("Register Number should only contain digits and  
alphabets.")
```

```
def valmob(m):
```

```
    if(len(m)!=10):
```

```
        print("Invalid with exception message: Mobile Number should have exactly  
10 characters.")
```

```
    if(not m.isdigit()):
```

```
        raise numberformat("Mobile Number should only contain digits.")
```

```

```

```
    print("Valid")
```

```
except (illegalargument,nosuchelement,numberformat) as e:
```

```
    print(f"Invalid with exception message: {e}")
```

Status : Correct

Marks : 10/10

#### 4. Problem Statement

Implement a program that checks whether a set of three input values can form the sides of a valid triangle. The program defines a function `is_valid_triangle` that takes three side lengths as arguments and raises a `ValueError` if any side length is not a positive value. It then checks whether the sum of any two sides is greater than the third side to determine the validity of the triangle.

##### *Input Format*

The first line of input consists of an integer A, representing side1.

The second line of input consists of an integer B, representing side2.

The third line of input consists of an integer C, representing side3.

##### *Output Format*

The output prints either "It's a valid triangle" if the input side lengths form a valid triangle,

or "It's not a valid triangle" if they do not.

If there is a `ValueError`, it should print "ValueError: <error\_message>".

Refer to the sample output for the formatting specifications.

##### *Sample Test Case*

Input: 3

4

5

Output: It's a valid triangle

##### *Answer*

# You are using Python

```
class ValueError(Exception):
    pass
def is_valid_triangle():
    try:
        a=int(input())
        b=int(input())
        c=int(input())
        if a<=0 or b<=0 or c<=0:
            raise ValueError
            exit()
        if (a+b)>c and (a+c)>b and (b+c)>a:
            print("It's a valid triangle")
        else:
            print("It's not a valid triangle")
    except ValueError:
        print("ValueError: Side lengths must be positive")
is_valid_triangle()
```

## NeoColab\_REC\_CS23221\_Python Programming

### REC\_Python\_Week 6\_PAH

Attempt : 1  
Total Mark : 30  
Marks Obtained : 30

### Section 1 : Coding

#### 1. Problem Statement

Peter manages a student database and needs a program to add students. For each student, Alex inputs their ID and name. The program checks for duplicate IDs and ensures the database isn't full.

If a duplicate or a full database is detected, an appropriate error message is displayed. Otherwise, the student is added, and a confirmation message is shown. The database has a maximum capacity of 30 students, and each student must have a unique ID.

#### ***Input Format***

The first line contains an integer n, representing the number of students to be added to the school database.

The next n lines each contain two space-separated values, representing the student's ID (integer) and the student's name (string).

### **Output Format**

The output will depend on the actions performed in the code.

If a student is added to the database, the output will display: "Student with ID [ID number] added to the database."

If there is an exception due to a duplicate student ID, the output will display: "Exception caught. Error: Student ID already exists."

If there is an exception due to the database being full, the output will display: "Exception caught. Error: Student database is full."

Refer to the sample outputs for the formatting specifications.

### **Sample Test Case**

Input: 3

16 Sam

87 Sabari

43 Dani

Output: Student with ID 16 added to the database.

Student with ID 87 added to the database.

Student with ID 43 added to the database.

### **Answer**

# You are using Python

```
class alreadyexist(Exception):
```

```
    pass
```

```
class databasefull(Exception):
```

```
    pass
```

```
try:
```

```
    n=int(input())
```

```
    l=[]
```

```
    for i in range(n):
```

```

if len(l)>=30:
    raise databasefull
a,b=map(str,input().split())
a1=int(a)
if a1 in l:
    raise alreadyexist
else:
    l.append(a1)
    print(f"Student with ID {a1} added to the database.")
except alreadyexist:
    print("Exception caught.Error: Student ID already exists.")
except databasefull:
    print("Exception caught.Error: Student database is full.")

```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

Reeta is playing with numbers. Reeta wants to have a file containing a list of numbers, and she needs to find the average of those numbers. Write a program to read the numbers from the file, calculate the average, and display it.

File Name: user\_input.txt

### **Input Format**

The input file will contain a single line of space-separated numbers (as a string).

These numbers may be integers or decimals.

### **Output Format**

If all inputs are valid numbers, the output should print: "Average of the numbers is: X.XX" (where X.XX is the computed average rounded to two decimal places)

If the input contains invalid data, print: "Invalid data in the input."

Refer to the sample output for format specifications.

### Sample Test Case

Input: 1 2 3 4 5

Output: Average of the numbers is: 3.00

### Answer

```
# You are using Python
with open("filename","w") as file:
    s=input().strip()
    tokens=s.split()
    n=[]
    for token in tokens:
        try:
            num=float(token)
            n.append(num)
        except ValueError:
            print("Invalid data in the input.")
            exit()
    if len(n)==0:
        print("Invalid data in the input.")
    else:
        avg=sum(n)/len(n)
        print(f"Average of the numbers is: {avg:.2f}")
```

Marks : 10/10

### 3. Problem Statement

John is a data analyst who often works with text files. He needs a program that can analyze the contents of a text file and count the number of times a specific character appears in the file.

John wants a simple program that allows him to specify a file and a character to count within that file.

### Input Format

The first line of input consists of the file's name to be analyzed.

The second line of the input consists of the string they want to write within the file.

The third line of the input consists of a character to count within the file.

### **Output Format**

If the character is found, the output displays "The character 'X' appears {Y} times in the file." where X is the character and Y is the count,

If the character does not appear in the file, the output displays "Character not found."

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: test.txt

This is a test file to check the character count.

e

Output: The character 'e' appears 5 times in the file.

### **Answer**

```
# You are using Python
filename=input().strip()
content=input().strip()
chartoc=input()
with open(filename,"w")as file:
    file.write(content)
with open(filename,"r")as file:
    data=file.read()
if chartoc.isupper():
    c=data.count(chartoc)+data.count(chartoc.lower())
elif chartoc.islower():
    c=data.count(chartoc)+data.count(chartoc.upper())
else:
    c=data.count(chartoc)
if c>0:
    print(f"The character '{chartoc}' appears {c} times in the file.")
else:
```

```
print("Character not found in the file.")
```
